## HEEL PAIN EFFECTIVE TREATMENT

**Finding the Right  
Solution to Effectively  
Treat and Even  
Reverse the Damage  
Causing your Pain.**

# HEEL PAIN

## EFFECTIVE TREATMENT

The majority of Heel Pain cases are caused by degeneration of the tissue supporting the foot (plantar fascia). This is easy to see and diagnose using ultrasound.

In some cases, the nerves of the foot may also be the source of heel pain. This is also easy to diagnose, with the proper training.

**AN ACCURATE AND COMPLETE DIAGNOSIS IS ESSENTIAL TO FINDING THE RIGHT TREATMENT.**

The latest research shows that most traditional and conservative treatment options are simply not effective in treating heel pain.

Using state of the art diagnostic methods, we can assess the progression of the disease process which helps determine which treatments will have the most success.

If you have tried orthotics, injections, special shoes, stretching, or any similar therapies and have not had significant relief, you are not alone.

If tissue degeneration is causing the pain, the most effective treatment is to remove the damaged areas and promote the growth of new, healthier tissue.

**MORE THAN 60% OF PEOPLE WILL BE AFFECTED BY HEEL PAIN AT SOME POINT IN THEIR LIFE.**

**We specialize in a minimally invasive procedure, utilizing the latest tissue regeneration technologies, which can potentially reverse the damage and stop your pain.**
